

Indole-3-sulphur derivatives

The present invention relates to substituted indoles useful as pharmaceutical compounds for treating respiratory disorders, pharmaceutical compositions containing them, and processes for their preparation.

EPA 1 170 594 discloses methods for the identification of compounds useful for the treatment of disease states mediated by prostaglandin D2, a ligand for orphan receptor CRTh2. GB 1356834 discloses a series of compounds said to possess anti-inflammatory, analgesic and antipyretic activity. It has now surprisingly been found that certain indole acetic acids are active at the CRTh2 receptor, and as a consequence are expected to be potentially useful for the treatment of various respiratory diseases, including asthma and COPD.

In a first aspect the invention therefore provides a compound of formula (I) or a pharmaceutically acceptable salt thereof:

The present invention also provides a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, as herein before defined, in association with a pharmaceutically acceptable adjuvant, diluent or carrier.

20 The pharmaceutical compositions may be administered topically (e.g. to the lung and/or airways or to the skin) in the form of solutions, suspensions, heptafluoroalkane aerosols and dry powder formulations; or systemically; e.g. by oral administration in the form of tablets, capsules, syrups, powders or granules, or by parenteral administration in the form 25 of solutions or suspensions, or by subcutaneous administration or by rectal administration in the form of suppositories or transdermally. Ligand Binding Assay

[³H]PGD₂ was purchased from Perkin Elmer Life Sciences with a specific activity of 100-
10 210Ci/mmol. All other chemicals were of analytical grade.

HEK cells expressing rhCRTh2 / Gα16 were routinely maintained in DMEM containing
10% Foetal Bovine Serum (HyClone), 1mg/ml geneticin, 2mM L-glutamine and 1% non-
essential amino acids. For the preparation of membranes, the adherent transfected
15 HEKcells were grown to confluence in two layer tissue culture factories (Fisher, catalogue
number TKT-170-070E). Maximal levels of receptor expression were induced by addition
of 500mM sodium butyrate for the last 18 hours of culture. The adherent cells were washed
once with phosphate buffered saline (PBS, 50ml per cell factory) and detached by the
addition of 50ml per cell factory of ice-cold membrane homogenisation buffer [20mM
20 HEPES (pH 7.4), 0.1mM dithiothreitol, 1mM EDTA, 0.1mM phenyl methyl sulphonyl
fluoride and 100μg/ml bacitracin]. Cells were pelleted by centrifugation at 220xg for 10
minutes at 4°C, re-suspended in half the original volume of fresh membrane
homogenisation buffer and disrupted using a Polytron homogeniser for 2 x 20 second
bursts keeping the tube in ice at all times. Unbroken cells were removed by centrifugation
25 at 220xg for 10 minutes at 4°C and the membrane fraction pelleted by centrifugation at
90000xg for 30 minutes at 4°C. The final pellet was re-suspended in 4ml of membrane
homogenisation buffer per cell factory used and the protein content determined.
Membranes were stored at -80°C in suitable aliquots.

30 All assays were performed in Corning clear bottomed, white 96-well NBS plates (Fisher).
Prior to assay, the HEK cells membranes containing CRTh2 were coated onto SPA PVT
WGA beads (Amersham). For coating membranes were incubated with beads at typically
25μg membrane protein per mg beads at 4°C with constant agitation overnight. (The
optimum coating concentrations were determined for each batch of membranes) The beads
35 were pelleted by centrifugation (800xg for 7minutes at 4°C), washed once with assay

buffer (50mM HEPES pH 7.4 containing 5mM magnesium chloride) and finally re-suspended in assay buffer at a bead concentration of 10mg/ml.

Each assay contained 20 μ l of 6.25nM [3 H]PGD₂, 20 μ l membrane saturated SPA beads both in assay buffer and 10 μ l of compound solution or 13,14-dihydro-15-keto prostaglandin D₂ (DK-PGD₂, for determination of non-specific binding, Cayman chemical company). Compounds and DK-PGD₂ were dissolved in DMSO and diluted in the same solvent to 100x the required final concentration. Assay buffer was added to give a final concentration of 10% DMSO (compounds were now at 10x the required final concentration) and this was the solution added to the assay plate. The assay plate was incubated at room temperature for 2 hours and counted on a Wallac Microbeta liquid scintillation counter (1 minute per well).

Compounds of formula (I) have an IC₅₀ value of less than (<) 10 μ M. Specifically example 2 has a pIC₅₀ = 8.1 example 6 has a pIC₅₀ = 7 and example 7 has a pIC₅₀ = 6.6
